```
DS 320 Algorithms for Data Science Spring 2023
```

Lecture \#1 Worksheet<br>Prof. Kira Goldner

Covered in introduction slides:

- Course policies (also in syllabus).
- What to expect in this class (also in FAQ).
- Sample of content we'll cover.

## Runtime Review

In runtime analysis we do an informal accounting. We count basic operations (algebra, array assignment, etc) as constant time. ${ }^{1}$

Analyze the runtime of the following algorithm:

```
Algorithm 1 FindMinIndex \((B[t+1, n])\).
    Let MinIndex \(=t+1\).
    for \(i=t+1\) to \(n\) do
        if \(B[i]<B[\) MinIndex \(]\) then
            MinIndex \(=i\).
        end if
    end for
    return MinIndex.
```

Which operations are constant-time?

Are there any loops? How many times do they run?

How does everything come together?

Which factors dominate asymptotically?

[^0]
## Asymptotic Notation

Definition 1 (Upper bound $O(\cdot)$ ). For a pair of functions $f, g: \mathbb{N} \rightarrow \mathbb{R}$, we write $f \in O(g(n))$ if there exist $(\exists)$ constants $c_{1}, c_{2}$ such that for all (s.t. $\forall$ ) $n \geq c_{1}$,

$$
f(n) \leq c_{2} g(n)
$$

We'll often write $f(n)=O(g(n))$ because we are sloppy.
Translation: For large $n$ (at least some $c_{1}$ ), the function $g(n)$ dominates $f(n)$ up to a constant factor.

Definition 2 (Lower bound $\Omega(\cdot)$ ). For a pair of functions $f, g: \mathbb{N} \rightarrow \mathbb{R}$, we write $f \in \Omega(g(n))$ if there exist constants $c_{1}, c_{2}$ such that for all $n \geq c_{1}$,

$$
f(n) \geq c_{2} g(n)
$$

Definition 3 (Tight bound $\Theta(\cdot))$. For a pair of functions $f, g: \mathbb{N} \rightarrow \mathbb{R}$, we write $f \in \Theta(g(n))$ if $f \in O(g(n))$ and $f \in \Omega(g(n))$.

Exercise: True or False?

| $f(n)$ | $g(n)$ | $O(g(n))$ | $\Omega(g(n))$ | $\Theta(g(n))$ |
| :---: | :---: | :---: | :---: | :---: |
| $10^{6} n^{3}+2 n^{2}-n+10$ | $n^{3}$ |  |  |  |
| $\sqrt{n}+\log n$ | $\sqrt{n}$ |  |  |  |
| $n(\log n+\sqrt{n})$ | $\sqrt{n}$ |  |  |  |
| $n$ | $n^{2}$ |  |  |  |

Definition 4 (Strict upper bound $o(\cdot)$ ). For a pair of functions $f, g: \mathbb{N} \rightarrow \mathbb{R}$, we write $f \in o(g(n))$ if

$$
\lim _{n \rightarrow \infty} \frac{f(n)}{g(n)}=0
$$

or equivalently, for any constant $c_{2}>0$, there exists a constant $c_{1}$ such that for all $n \geq c_{1}$,

$$
f(n)<c_{2} g(n)
$$

Definition 5 (Strict lower bound $\omega(\cdot))$. For a pair of functions $f, g: \mathbb{N} \rightarrow \mathbb{R}$, we write $f \in \omega(g(n))$ if

$$
\lim _{n \rightarrow \infty} \frac{f(n)}{g(n)}=\infty
$$

or equivalently, for any constant $c_{2}>0$, there exists a constant $c_{1}$ such that for all $n \geq c_{1}$,

$$
f(n)>c_{2} g(n)
$$

## Asymptotic Properties

- Multiplication by a constant:

If $f(n)=O(g(n))$ then for any $c>0, c \cdot f(n)=$

- Transitivity:

If $f(n)=O(h(n))$ and $h(n)=O(g(n))$ then $f(n)=$

- Symmetry:

If $f(n)=O(g(n))$ then $g(n)=$
If $f(n)=\Theta(g(n))$ then $g(n)=$

- Dominant Terms:

If $f(n)=O(g(n))$ and $d(n)=O(e(n))$ then $f(n)+d(n)=O(\max \{g(n), e(n)\})$. It's fine to write this as $O(g(n)+e(n))$.

## Common Functions

- Polynomials: $a_{0}+a_{1} n+\cdots+a_{d} n^{d}$ is $\Theta\left(n^{d}\right)$ if $a_{d}>0$.
- Polynomial time: Running time is $O\left(n^{d}\right)$ for some constant $d$ independent of the input size $n$.
- Logarithms: $\log _{a} n=\Theta\left(\log _{b} n\right)$ for all constants $a, b>0$. This means we can avoid specifying the base of the logarithm.
For every $x>0, \log n=o\left(n^{x}\right)$. Hence $\log$ grows slower than every polynomial.
- Exponentials: For all $r>1$ and all $d>0, n^{d}=o\left(r^{n}\right)$. Every polynomial grows slower than every exponential
- Factorial: By Sterling's formula, factorials grow faster than every exponential:

$$
n!=(\sqrt{2 \pi n})\left(\frac{n}{e}\right)^{n}(1+o(1))=2^{\Theta(n \log n)}
$$

[^0]:    ${ }^{1}$ This isn't quite right—for example, multiplication of large numbers should scale with the bit complexity-but is a good approximation for us.
